Sponsored Research Projects:

1. "Development of Machine Learning Tools for Speckle Reduction and Urban Applications" Duration: 4 Years (May 2017- March 2021), L & S band Airborne SAR RA, Sponsored by Space Application Centre, ISRO

Objectives:

1. Development of a technique using Machine Learning for speckle removal to improve classification accuracy of various urban features
2. Classify the settlement into various land-cover features

Languages/Software: Python, Matlab, PolSARPro

Algorithms:

- SOFM
- DFT Based Speckle Filter
- Morphology Based Speckle Filter
- Random Forest Classifier
- Artificial Neural Network (ANN)
- Decision Tree Classifier

Outcome:

1. Machine learning algorithm is developed for speckle removal
 2. DFT and Morphology Based Speckle Filter is developed
 3. A code is developed in MATLAB to compare two speckle filters based on various parameters
 4. Classification tool is developed to apply Random Forest, Neural Network and Decision Tree on PolSAR images using MATLAB
 5. The python code is developed for semantic segmentation
2. Minor Research Proposal sponsored by University of Mumbai. Title: "Regression Based Crop Yield Estimation Model". Duration: 01 Year (2019-2020)

Objectives:

- To collect the available hydrological, meteorological, agrological, and biological data available in public domain for three specific crops. Eg. Onion, Sugarcane, Tomato etc.
- Use well established techniques to structure the collected data to make it platform independent and improve data usability
- Study and characterize the yield variation and its dependency on various multi-disciplinary parameters for each of the identified crop
- Identify the appropriate regressive model for the crops for yield estimation
- Recommendations to the farmer in local language based on the model output.

Languages/Software: Python, Django

Algorithms: Multiple Regression

Outcome:

A novel crop yield estimation method using regression models for three different crops is developed using publicly available data from both government and semi government organizations. The approach can also be extended to other crops and for various other regions too. Depending on availability of other sensor specific data, the basic framework may be expanded.

3. Contributed in "Development of land parameter retrieval techniques and tools", Duration: four years (2011-2014), sponsored by ISRO during PhD

Objectives:

1. Develop a better, efficient, and effective method for polarimetric SAR image classification
2. Study various polarization combinations (full, dual and hybrid) for the classification of various land features
3. Study different frequencies and different decomposition techniques for classification of various land features
4. Comparison of classification accuracy of polarimetric SAR data and optical data to study the synergy of both remote sensing techniques

Languages/Software: MATLAB, PolSARPro, ENVI, NEST

Algorithms:

- Wishart Classifier
- Support Vector Machine (SVM) Classifier
- Decision Tree Classifier
- ANN Classifier
- Maximum Likelihood Classifier

Outcome:

1. Technique is developed for classification of multi-frequency and multi-polarized data which is acquired from different sensors having different resolution.
2. ANN classifier algorithm is developed using MATLAB
3. It is proved that the use of non-parametric classifiers (ANN, SVM and DTC) is effective compared to parametric classifiers
4. The methodology is developed to increase the classification accuracy by combining Circular Polarization Ratio (CPR) and SPAN with m-delta decomposed image. First time CPR has been used in land-based study
5. The technique is developed to fuse the optical and multi-frequency PolSAR data to get good classification accuracy
6. The effective technique to classify the oriented urban area using Circular Correlation Coefficient (CCC) and polarization orientation compensation (POC) along with all the components of decomposition is developed
